- Sub-dissolvable and splittable conjugated microfiber and a process for preparing same.
- There is provided a process for preparing a sub-soluble and splittable, conjugated microfiber with a cross section having matrix orange Islands and slightly connected with each other at the tip of the orange Island in the matrix center. Conjugated fibers can be made into filaments and staple fibers. Filaments are spinning taken-up and then is carried out texturing by means of a belt nip twister and the resulting texture yarns are sub-dissolved following weaving to split. As to the staple fibers, it is staple fiber processed to obtain staple fibers and followed by processing into non-wovens or spinning to spun yarn and then weaving. Owing to a different splitting method from filament fabrics, staple fibers can be made to fabrics as follows:
 - 1. Suede fabrics;
 - 2. Water resistant and humid permeable, high density fabrics;
 - 3. Peachskin fabrics.

EP 0 455 927 A1

Heretofore the processing of filaments of synthetic fibers, such as for example, PET, PP, PA and the like made by a melt spinning method is:

10

35

40

and the processing of staple fibers is:

spinning drawing heatsetting crimping drying cutting to staple fiber

In general, if synthetic leathers want to have genuine leather-like soft surface touch, a titer thereof should be at least below 0.4 d. However, fibers of 0.4 d or less can hardly be produced by a conventional spinning method mentioned above. Even if fibers below 0.4 d can be produced it is difficult to put to the application of weaving. Now there are many types of conjugated fibers, such as, for example Fig. 1A is a cross sectional view of the conjugated fibers produced by Kanebo, Japan, Fig. 1B is a cross sectional view of the conjugated fibers produced by Teijin, Japan, and Fig. 1C is a cross sectional view of the conjugated fibers produced by Toray, Japan. Conjugated fibers of each of Figs. 1A and 1B are of matrix types and are made by conjugated spinning two different kinds of polymer. But these two types can be put to the production of flat yams only and they cannot be used in false twisting due to if they are used in false twisting it is easy to split and results to fluff and difficult in weaving. Conjugated fibers of Fig. 1C is of a sea and islands type and also made by conjugated spinning two different kinds of polymers. Said sea component should be completely dissolved to obtain fiber ingredient fibers of island. Owing to the sea component should be dissolved completely the coat is increased.

The present invention is directed to the improvement of the above mentioned disadvantages and the improvement is characterized in that the production and the spinning are like a regular yarn however a sub-dissolving and splitting is performed following spinning.

A more complete understanding of these and other features and advantages of the present invention will become apparent from a careful consideration of the following detailed description of certain embodiments illustrated in the accompanying drawings.

In the drawings:

- Fig. 1A is a cross sectional view of conjugated microfibers obtained from Kanebo, Japan now;
- Fig. 1B is a cross sectional view of conjugated microfibers obtained from Teijin, Japan now;
- Fig. 1C is a cross sectional view of conjugated microfibers obtained from Toray, Japan now;
- Fig. 2 is a schematic diagram of a spinneret according to the invention;
- Fig. 3A is a cross sectional view of the fiber according to the invention before splitting;
- Fig. 3B is a cross sectional view of the fiber according to the invention after splitting;
- Fig. 4 is a flow chart of finishing the conjugated yarn of the invention by means of a belt nip twister;
- Fig. 5 is a processing procedure chart for the conjugated micro-staple fiber of the invention.

The process according to the present invention is illustrated as follows.

Polyester (PET) and polyamide (PA), the starting materials of the invention, in a ratio of polyester/polyamide of 20-80/80-20 are extruded through an extrusion apparatus of a spinneret in Fig. 2. Fibers produced by said apparatus have a cross section of matrix orange islands and connected slightly at the matrix center. Orange islands can be 3 to 12 islands in accordance with the design of the spinneret. Conjugated fibers of the invention come out from the bores (A) of Fig. 2 at a temperature of 270 to 300° C. During spinning the dynamic viscosity is 2000 to 3500 poises in the case of polyester and 800 to 2500 poises in case of polyamide. An appropriate take-up speed is 500 to 4000 m/min and a draft ratio is 50 to 500. As shown in Fig. 3, the resultant un-drawn conjugated yam has a cross section of matrix orange islands. The number of the orange islands is from 3 to 12.

The un-drawn yarn obtained by spinning the conjugate filament is subjected to the following procedures. As shown in Fig. 4, the undrawn yarn cake is on a creel 41 through a high speed belt nip twister, and then passes through a yarn cutter 42 to be introduced into a first feed roller 43 passing through a primary heater 44 at a temperature of 100 to 180 °C, a ballon control plate 46, a short ballon control bar 47, a yarn wire guide 471, a pre-twister guide 472 and thereafter be fed into a nip twister 48 having a twist level of 3000 to 4000 T/M and a twister cross angle of 110 to 130 degree. Following passing through a self-force twisting bearing roller 473, the yarn is fed into a second feed roller 49 at a draw ratio (a ratio of the speed of 43 to the speed of 49) between 1.5 and 3.5 and a B/Y ratio (belt speed/yarn speed) between 1.62 and 2.2

and passes through a secondary heater 410, a third feed roller 411. The second feed roller overfeeds 1.5 to 2.5% and the third feed roller overfeeds 2.0 to 3.5%. And then following passing through a yarn feeder 412, an oil roller 413 and finally through a winder 414, the yarn is taken-up as conjugated texture yarn having a titer from 30 to 450 d, and a filament count from 12 to 128.

After weaving or knitting the conjugated texture yarn of the invention into a cloth, it should be subresolved to split. A sub-resolving ratio usually is in the range of 10 to 40% depending on the types of the finishing fabrics. The sub-resolving ratio of raised fabrics is between 10 to 20%, that of high density fabrics between 15 to 40%, and as to peach skin fabrics the ratio is between 10 to 30%. Following sub-resolving for splitting the titer per single filament is in the range of 0.01 to 0,5 wherein it comprises polyamide and polyester. Raised fabrics have a suede feeling. In case of high density fabrics, it can be used as water resistant and humid permeable fabrics and suitable for applied in jackets, coats, casual wears and the like. As to buffing fabrics with a peach skin feel, it can be used in lady's wears, skirts, slacks and the like.

The microfiber of the invention will be un-splittable during the process of conjugate spinning and twisting. The fiber will not split until following weaving or knitting the sea component of the fiber of the cloth is sub-resolved. A cross section of the fiber is shown in Fig. 3A and that afterwards is in Fig. 3B.

The process of the invention can also find its application in the manufacture of a staple fiber. The same spinneret as in Fig. 2 is employed. It has a hole number of 200 to 300, a through-put temperature of 270 to 300 °C, a dynamic viscosity of polyester during the melt spinning process between 2000 and 3500 poises and that for polyamide being 800 to 2500 poises, as well as a winding speed of 500 to 1500 m/min. The resultant fiber is an un-drawn spin tow of conjugated fiber with a cross section of matrix orange islands as shown in Fig. 3A. Being subjected to the processing procedure of Fig. 5 with a draw ratio of 3.0 to 4.5, a drawing temperature of 70 to 120°C, a heat setting temperature of 40 to 150°C and a drying temperature of 60 to 130°C, the drawn tow of conjugated fiber will be cut into a drawn crimped conjugated staple fiber of 0.5 to 5 d having a length of 32 to 102 mm. The conjugated staple fiber will be used for non-woven purposing or spinning to 20 to 45's spun yarn.

The woven fabrics made of the fiber of the invention may be heavy fabrics or light fabrics or there between. These fabrics can be made into jackets, coats, skirts, pants, suits, slacks, vests, gloves and the like. Besides they can find usages in wiping cloth, glass cleaning cloth, car cleaning cloth, and cleaning cloth for optical instruments and integrated circuit and also be manufactured to a product of manufacture, such as an ultrafine filter, printing ribbon, synthetic leather, shoes, handbag and suitcase, etc.

EXAMPLES

Example 1

35

The production and the yield are normal while conjugated spinning under the following conditions. Polyester and nylon-6 are subjected to conjugated spinning at a temperature of 285 °C, extruding through a spinneret having a hole number of 32, a through-put speed of 10 m/min, a through-put mass rate of 0.9 g/min-hole, a winding speed of 1500 m/min, a dynamic viscosity of PET being 2500 poises and that of nylon being 1500 poises.

The resultant un-drawn conjugated filament has a fineness of 173 d. The provisions of the undrawn filament being twisted by means of the belt nip twister as shown in Fig. 4 are as follows.

Texturing machine. MACH CRIMPER 3311

Speed: 500 m/min Draw ratio: 2.3

Drawing temperature: 140°C

B/Y ratio: 1.8

Second overfeed: 2.0% Third overfeed: 2.5% Twist level 3500 T/M Belt cross angle: 115

The drawn-texture yam obtained from the above-mentioned twisting has a tenacity of 4.1 g/d, an elongation of 30%, a boiling water shrinkage (BWS) of 11% and a crimp rigidity (CR) of 15%.

55 Example 2

Polyester and nylon-6 are subjected to conjugated spinning at a temperature of 280°C, extruding out through a spinneret having a hole number of 280, a through-put rate of 2.67 m/min, a through-put mass rate

EP 0 455 927 A1

of 1 g/min, a take up speed of 1200 m/min, a spin denier of 7.5 d, a dynamic viscosity of PET being 1500 poises and that of nylon-6 also 1500 poises. An un-drawn spin-tow is produced by conjugated spinning performed under the aforementioned spinning condition. In the process as shown in Fig. 5, the tow is drawn at 80°C with a draw ratio of 3.0, after that the drawn tow is subjected to crimping with a crimper following heat setting, being dried at 110°C and followed by cutting to a conjugated staple fiber of 2.5 d x 51 mm. Said conjugated staple fiber can be used for synthetic leathers through non-woven processing or as fabrics by spinning to spun yam.

Ü

- 1. A process for preparing a conjugated microfilament in which it is characterized in that the cross of the conjugated microfilament, the polyamide parts are in the form of a matrix orange island and are surrounded by the sea parts of polyester, number of the orange islands is 3 to 12, following the outmost circle of said polyester being sub-dissolved it can be splitted into 3 to 12 sections of polyester, 3 to 12 sections of polyamide and becomes total of 6 to 24 split conjugated filaments of polyester and polyamide, the process comprising separately the polyester and the polyamide being melt metered and then extruded through a conjugated spinneret (Fig. 2), the conjugated polymer having a temperature of 270 to 300° C, a dynamic viscosity during the spinning of 2000 to 3500 poises in PET, of 800 to 2000 poises in nylon, a winding speed of 500 to 4000 m/min, and the undrawn conjugated yam obtained from the spinning being passed through a belt nip twister (48) with a draw ratio of 1.5 to 4.5, a speed of 300 to 600 m/min, a drawing temperature of 100 to 180° C, a twist level of 3000 to 4000 T/M, a belt cross angle of 110 to 130° C, a ratio of belt speed/yam speed between 1.62 to 2.2, second feed roller (49) overfeed of 1.5 to 2.5%, and third feed roller (411) overfeed of 2.0 to 3.5%, and the conjugated texture yam obtained through the twist processing having a titer of 30 to 450 d and a filament count of 12 to 128.
- 2. A process for preparing conjugated micro-staple fiber in which it is characterized in that the cross section of the conjugated microfilament, the polyamide parts are in the form of a matrix orange island and are surrounded by the sea parts of polyester, number of the orange islands is 3 to 12, following the outmost circle of said polyester being sub-dissolved it can be split into 3 to 12 sections of polyester, 3 to 12 sections of polyamide and becomes total of 6 to 24 split conjugated filaments of polyester and polyamide, the process comprising separately the polyester and the polyamide being melt metered and then extruded through a conjugated spinneret (Fig. 2), the conjugated polymer having a temperature of 270 to 300° C, a dynamic viscosity during the spinning of 2000 to 3500 poises in PET, of 800 to 2000 poises in nylon, a winding speed of 500 to 1500 m/min, the un-drawn conjugated spin-tow having a draw ratio of 3.0 to 4.5, a drawing temperature of 40 to 120° C, a heat setting temperature of 40 to 150° C, and a drying temperature of 60 to 130° C, it being chopped into 0.5 to 5 d conjugated staple fibers with a length 32 to 102 mm and the conjugated staple fibers being spun into 20 to 45's spun yarn.
